Chapter 1

The AMORE++ package

1.1 Introduction

Here you will find the documentation of the C++ component of the AMORE++ R package. The AMORE++ package is a new version of the publicly available AMORE package for neural network training and simulation under R

1.2 Motivation

Since the release of the previous version of the AMORE many things have changed in the R programming world. The advent of the Reference Classes and of packages like Rcpp, inline and RUnit compel us to write a better version of the package in order to provide a more useful framework for neural network training and simulation.

1.3 Road Map

This project is currently very active and the development team intends to provide a beta version as soon as this summer (2011)

Class Documentation

6.1 CompareId Struct Reference

Public Member Functions

- bool operator() (const ConPtr a, const ConPtr b)
- bool operator() (const ConPtr a, const int b)
- bool operator() (const int a, const ConPtr b)
- bool operator() (const int a, const int b)

6.1.1 Detailed Description

Definition at line 367 of file VecCon.cpp.

6.1.2 Member Function Documentation

6.1.2.1 bool CompareId::operator() (const ConPtr *a*, const ConPtr *b*) [inline]

Definition at line 369 of file VecCon.cpp.

```
                                                        {
        return a->getId() < b->getId();
    };
```

6.1.2.2 bool CompareId::operator() (const int *a*, const int *b*) [inline]

Definition at line 381 of file VecCon.cpp.

```
                                                    {
            return a < b;
        };
```

6.1.2.3 bool CompareId::operator() (const int *a*, const ConPtr *b*) [inline]

Definition at line 377 of file VecCon.cpp.

```
                                                    {
        return a < b->getId();
    };
```

6.1.2.4 bool CompareId::operator() (const ConPtr *a*, const int *b*) [inline]

Definition at line 373 of file VecCon.cpp.

```
                                                    {
        return a->getId() < b  ;
    };
```

The documentation for this struct was generated from the following file:

- pkg/AMORE/src/VecCon.cpp

6.2 Con Class Reference

A class to handle the information needed to describe an input connection.

`#include <Con.h>`

Public Member Functions

- Con ()
  Default Constructor.
- Con (NeuronPtr f)
  Constructor.
- Con (NeuronPtr f, double w)
  Constructor.
- ~Con ()
  Default Destructor.
- NeuronPtr getFrom ()
  from field accessor.
- void setFrom (NeuronPtr f)
  from field accessor.
- int getId ()
  A getter of the Id of the Neuron pointed by the from field.
- double getWeight ()
  weight field accessor.

- void setWeight (double w)

  weight field accessor.
- bool show ()

  Pretty print of the Con information.
- bool validate ()

  Object validator.

Private Attributes

- NeuronWeakPtr from

  A smart pointer to the Neuron used as input during simulation or training.
- double weight

  A double variable that contains the weight of the connection.

6.2.1 Detailed Description

A class to handle the information needed to describe an input connection.

The Con class provides a simple class for a connection described by a pair of values: a pointer to a Neuron object used as the from field and the weight used to propagate the value of that Neuron object.

Definition at line 16 of file Con.h.

6.2.2 Constructor & Destructor Documentation

6.2.2.1 Con::Con ( )

Default Constructor.

Definition at line 18 of file Con.cpp.

```
        : weight(0), from() {
};
```

6.2.2.2 Con::Con (NeuronPtr *f*)

Constructor.

Definition at line 36 of file Con.cpp.

```
: from(f), weight(0) {};
```

6.2.2.3 Con::Con (NeuronPtr *f*, double *w*)

Constructor.

Definition at line 28 of file Con.cpp.

```
: from(f), weight(w) {};
```

6.2.2.4 Con::~Con ( )

Default Destructor.

Definition at line 41 of file Con.cpp.

```
{};
```

6.2.3 Member Function Documentation

6.2.3.1 NeuronPtr Con::getFrom ( )

from field accessor.

This method allows access to the address stored in the private from field (a pointer to a Neuron object).*

Returns

A pointer to the Neuron object referred to by the from field.

```
  //================
  //Usage example:
  //================
  // Data set up
                  NeuronPtr ptShNeuron ( new Neuron(1) );          // Neuron
 Id is set 1
                  ConPtr ptShCon( new Con(ptShNeuron) );           // from p
oints to ptShNeuron and weight is set to 0
  // Test
                  ptShNeuron = ptShCon->getFrom() ;
                  int result = ptShNeuron->getId();

  // Now, result is equal to 1.
```

See also

getId and the unit test files, e.g., runit.Cpp.Con.R, for further examples.

Definition at line 65 of file Con.cpp.

References from.

```
                                                  {
      return(from.lock());
}
```

6.2.3.2 int Con::getId ( )

A getter of the Id of the Neuron pointed by the from field.

This method gets the Id of the Neuron referred to by the from field

Returns

The value of the Id (an integer).

```
        //================
        //Usage example:
        //================
        // Data set up
                        NeuronPtr ptShNeuron ( new Neuron(16) );        // Neuron
       Id is set to 16
                        ConPtr ptShCon( new Con(ptShNeuron) );          // from p
      oints to ptShNeuron and weight is set to 0
        // Test
                        int result = ptShCon->getId();

        // Now, result is equal to 16.
```

See also

getFrom, setFrom and the unit test files, e.g., runit.Cpp.Con.R, for further examples.

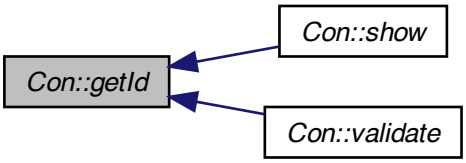
Definition at line 117 of file Con.cpp.

References from.

Referenced by show(), and validate().

```
                {
        if (from.use_count() !=0 ){
                NeuronPtr ptNeuron(from);
                return(  ptNeuron->getId() );
        } else {
                return(NA_INTEGER);
        }
}
```

Here is the caller graph for this function:



6.2.3.3 double Con::getWeight ( )

weight field accessor.

This method allows access to the value stored in the private field weight

Returns

The value of weight (double)

```
//================
//Usage example:
//================
// Data set up
                      std::vector<double> result;
                      NeuronPtr ptShNeuron ( new Neuron(16) );                /
    / Neuron Id is set to 16
                      ConPtr ptShCon( new Con(ptShNeuron, 12.4) );  // from poi
    nts to ptShNeuron and weight is set to 12.4
      // Test
                      result.push_back( ptShCon->getWeight() );
                      ptShCon->setWeight(2.2);
                      result.push_back( ptShCon->getWeight() );

      // Now, result is a numeric vector that contains the values 12.4 and 2.2
    .
```

See also

setWeight and the unit test files, e.g., runit.Cpp.Con.R, for further examples.

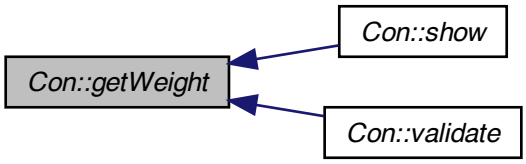
Definition at line 151 of file Con.cpp.

References weight.

Referenced by show(), and validate().

```
                    {
        return(weight);
}
```

Here is the caller graph for this function:



6.2.3.4 void Con::setFrom (NeuronPtr *f*)

from field accessor.

This method sets the value of the from field with the address used as parameter.

Parameters

f	A pointer to the neuron that is to be inserted in the from field.

```
        //================
        //Usage example:
        //================
        // Data set up
                        NeuronPtr ptShNeuron ( new Neuron(1) );          // Neuron
      Id is set to 1
                        ConPtr ptShCon( new Con() );
                        ptShCon->setFrom( ptShNeuron );
        // Test
                        ptShNeuron = ptShCon->getFrom() ;
                        int result = ptShNeuron->getId();

        // Now, result is equal to 1
```

See also

getFrom and getId contain usage examples. For further examples see the unit test files, e.g., runit.Cpp.Con.R

Definition at line 92 of file Con.cpp.

References from.

```
                                          {
        from=f;
}
```

6.2.3.5 void Con::setWeight (double *w*)

weight field accessor.

This method sets the value of the weight field.

Parameters

w	The new value (double) to be set in the weight field.

```
  //================
  //Usage example:
  //================
  // Data set up
                        std::vector<double> result;
                        NeuronPtr ptShNeuron ( new Neuron(16) );                /
      / Neuron Id is set to 16
                        ConPtr ptShCon( new Con(ptShNeuron, 12.4) );  // from poi
```

```
nts to ptShNeuron and weight is set to 12.4
                    result.push_back(ptShCon->getWeight());
  // Test
                    ptShCon->setWeight(2.2);
                    result.push_back(ptShCon->getWeight());

  // Now, result is a numeric vector that contains the values 12.4 and 2.2
.
```

See also

getWeight and the unit test files (e.g. runit.Cpp.Con.R)

Definition at line 180 of file Con.cpp.

References weight.

```
                                    {
  weight = w;
}
```

6.2.3.6 bool Con::show ( )

Pretty print of the Con information.

This method outputs in the R terminal the contents of the Con fields.

Returns

true in case everything works without throwing an exception

See also

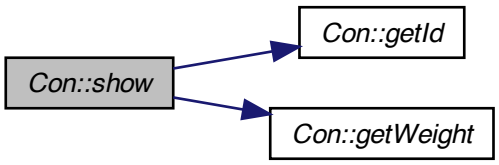
setWeight and the unit test files, e.g., runit.Cpp.Con.R, for usage examples.

Definition at line 192 of file Con.cpp.

References getId(), and getWeight().

```
        {
  int id=getId();
  if (id==NA_INTEGER) {
        Rprintf("From: NA\t Invalid Connection \n");
  } else {
        Rprintf("From:\t %d \t Weight= \t %lf \n", id , getWeight());
  }
  return(true);
}
```

Here is the call graph for this function:



6.2.3.7 bool Con::validate ( )

Object validator.

This method checks the object for internal coherence. A try / catch mechanism exits normal execution and returns control to the R terminal in case the contents of the Con object are identified as corrupted.

Returns

true in case the checks are Ok.

Exceptions

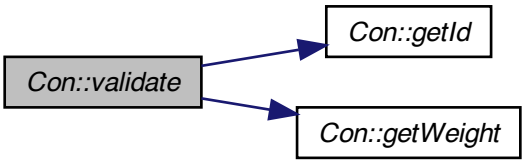
An	std::range error if weight or from are not finite.

Definition at line 211 of file Con.cpp.

References getId(), and getWeight().

```
                {
        BEGIN_RCPP
        if (! R_FINITE(getWeight()) )          throw std::range_error("weight is
       not finite.");
        if (getId() == NA_INTEGER )            throw std::range_error("fromId is
       not finite.");
        return(true);
        END_RCPP
};
```

Here is the call graph for this function:



6.2.4 Member Data Documentation

6.2.4.1 NeuronWeakPtr Con::from [private]

A smart pointer to the Neuron used as input during simulation or training.

The from field contains the address of the Neuron whose output will be used as input by the Neuron containing the Con object.

Definition at line 21 of file Con.h.

Referenced by getFrom(), getId(), and setFrom().

6.2.4.2 double Con::weight [private]

A double variable that contains the weight of the connection.

The weight field contains the factor by which the output value of the Neuron addressed by the from field is multiplied during simulation or training.

Definition at line 26 of file Con.h.

Referenced by getWeight(), and setWeight().

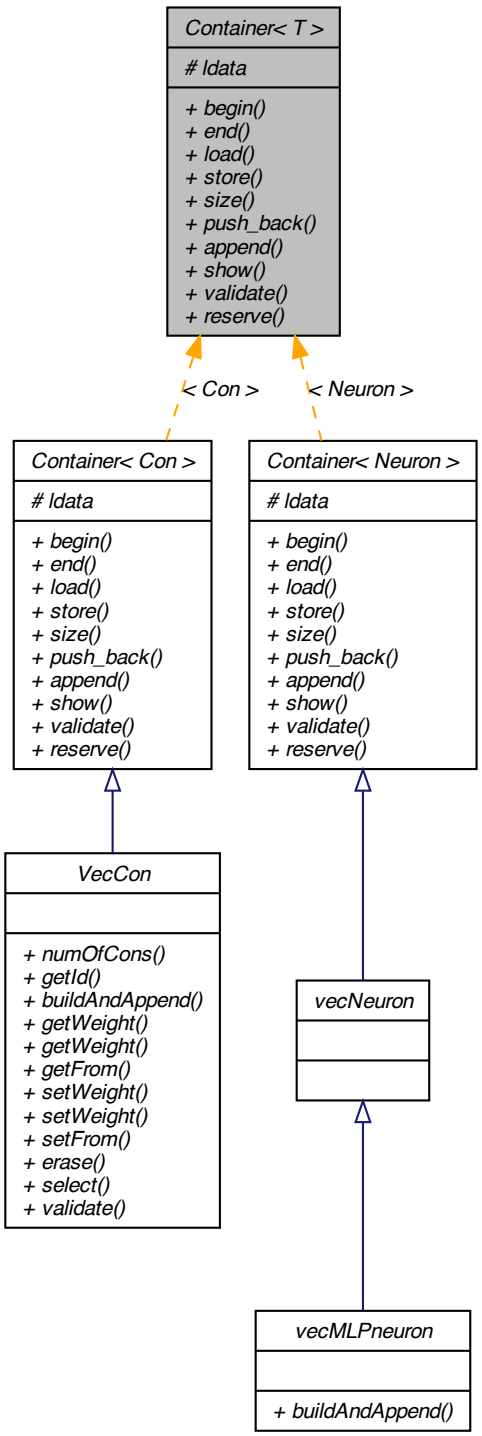
The documentation for this class was generated from the following files:

- pkg/AMORE/src/Con.h
- pkg/AMORE/src/Con.cpp

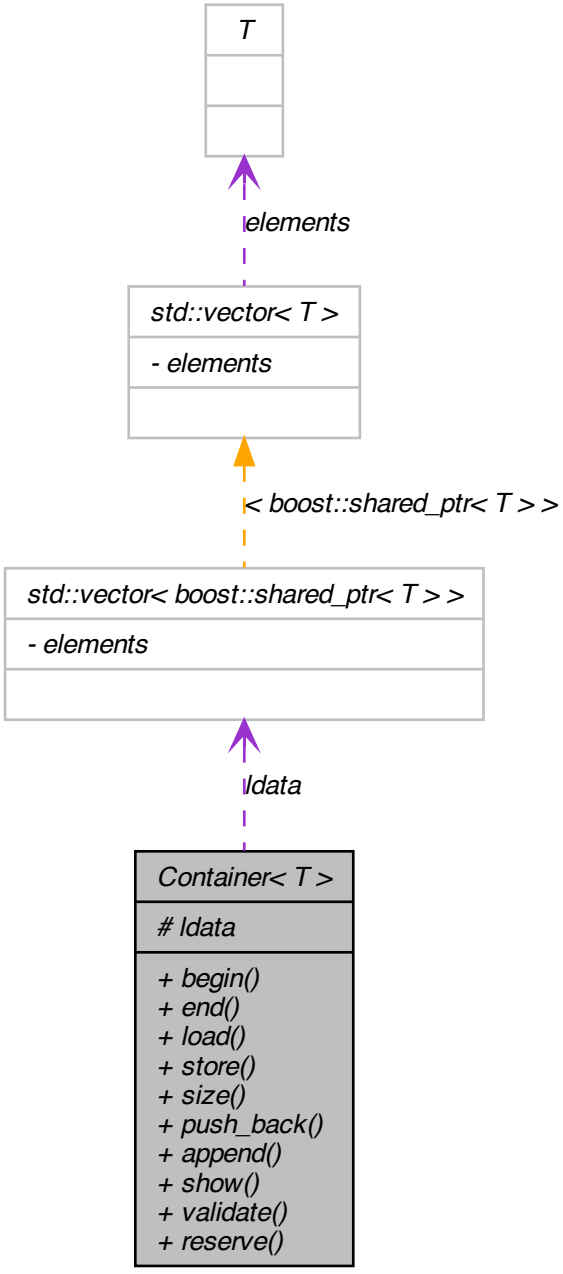
6.3 Container< T > Class Template Reference

`#include <Container.h>`

Inheritance diagram for Container< T >:



Collaboration diagram for Container< T >:



Public Types

- typedef std::vector< boost::shared_ptr< T > >::iterator iterator
- typedef std::vector< boost::shared_ptr< T > >::const_iterator const_iterator

Public Member Functions

- iterator begin ()
- iterator end ()
- std::vector< boost::shared_ptr< T > > load ()

  ldata field accessor function
- void store (typename std::vector< boost::shared_ptr< T > >)

  ldata field accessor function
- int size ()

  Returns the size or length of the vector.
- void push_back (boost::shared_ptr< T > element)

  Append a shared_ptr at the end of ldata.
- void append (Container< T > v)

  Appends a Container<T> object.
- bool show ()

  Pretty print of the Container<T>
- bool validate ()

  Object validator.
- void reserve (int n)

Protected Attributes

- std::vector< boost::shared_ptr< T > > ldata

6.3.1 Detailed Description

template<typename T>class Container< T >

Definition at line 12 of file Container.h.

6.3.2 Member Typedef Documentation

6.3.2.1 template<typename T> typedef std::vector<boost::shared_ptr<T> >::const_iterator Container< T >::const_iterator

Definition at line 19 of file Container.h.

6.3.2.2 template<typename T> typedef std::vector<boost::shared_ptr<T> >::iterator Container< T >::iterator

Definition at line 18 of file Container.h.

6.3.3 Member Function Documentation

6.3.3.1 template<typename T> void Container< T >::append (Container< T > *v*)

Appends a Container<T> object.

This method inserts the ldata field of a second object at the end of the ldata field of the calling object.

Parameters

v	The Container<T> object to be added to the current one

See also

The unit test files, e.g., runit.Cpp.Container.R, for usage examples.

```
  //================
  //Usage example:
  //================
  // Data set up
                          std::vector<int> result;
                          std::vector<ConPtr> vcA, vcB;
                          ContainerNeuronPtr      ptShvNeuron( new

store and the unit test files, e.g., runit.Cpp.Container.R, for usage examples.

Definition at line 217 of file Container.cpp.

```
                                                                        {
        return ldata;
};
```

6.3.3.5 template<typename T> void Container< T >::push_back (boost::shared_ptr< T > *TsharedPtr*)

Append a shared_ptr at the end of ldata.

Implements push_back for the Container class

Parameters

TsharedPtr	A shared_ptr pointer to be inserted at the end of ldata

```
                //================
                //Usage example:
                //================
                // Data set up
                        Neuron N1, N2, N3;
                        Container<Con> MyVecCon;
                        std::vector<ConPtr> vc;
                        std::vector<int> result;
                        N1.setId(10);
                        N2.setId(20);
                        N3.setId(30);
                // Test
                        ConPtr ptCon( new Con(&N1, 1.13) );     // Create new Con
       and initialize ptCon
                        MyVecCon.push_back(ptCon);                              /
      / push_back
                        ptCon.reset(  new Con(&N2, 2.22) );             // create
       new Con and assign to ptCon
                        MyVecCon.push_back(ptCon);                              /
      / push_back
                        ptCon.reset(  new Con(&N3, 3.33) );             // create
       new Con and assign to ptCon
                        MyVecCon.push_back(ptCon);                              /
      / push_back

                        vc = MyVecCon.load();

                        result.push_back(vc.at(0)->getId());
                        result.push_back(vc.at(1)->getId());
                        result.push_back(vc.at(2)->getId());
          // After execution of this code, result contains a numeric vector with va
      lues 10, 20 and 30.
```

```
                                                {

        // This is equivalent to:
        // for( auto x : ldata) { x.show(); }
        // Waiting for C++0x

        foreach (typename boost::shared_ptr<T> itr, ldata){
                itr->show();
        }
        return true;
};
```

6.3.3.8 template<typename T > int Container< T >::size ( )

Returns the size or length of the vector.

This method returns the size of the vector. In the classes derived from Container<T> this is aliased as numOfCons, numOfNeurons and numOfLayers. The unit test files, e.g., runit.Cpp.Container.R, for usage examples.

Definition at line 240 of file Container.cpp.

Referenced by Container< T >::append().

```
                                                {
        return ldata.size() ;
};
```

Here is the caller graph for this function:

6.3.3.9 template<typename T> void Container< T >::store (typename std::vector< boost::shared_ptr< T > > v)

ldata field accessor function

This method sets the value of the data stored in the ldata field.

Parameters

v	The vector of smart pointers to be stored in the ldata field

See also

load and the unit test files, e.g., runit.Cpp.Container.R, for usage examples.

Definition at line 229 of file Container.cpp.

```
      {
        ldata=v;
};
```

6.3.3.10 template<typename T > bool Container< T >::validate ( )

Object validator.

This method checks the object for internal coherence. This method calls the validate method for each element in ldata,

See also

The unit test files, e.g., runit.Cpp.Container.R, for usage examples.

Reimplemented in VecCon.

Definition at line 112 of file Container.cpp.

```
                                                {

                itr->validate();
        }
        return true;
};
```

6.3.4 Member Data Documentation

6.3.4.1 template<typename T> std::vector<boost::shared_ptr<T> > Container< T >::ldata [protected]

Definition at line 14 of file Container.h.

Referenced by Container< T >::append(), Container< Neuron >::begin(), and Container< Neuron >::end().

The documentation for this class was generated from the following files:

- pkg/AMORE/src/Container.h
- pkg/AMORE/src/Container.cpp

6.4 Neuron Class Reference

A class to handle the information contained in a general Neuron.

`#include <Neuron.h>`

Public Member Functions

- Neuron ()
- Neuron (int Id)
- ~Neuron ()
- int getId ()
- void setId (int id)

Private Attributes

- int Id

  An integer variable with the Neuron Id.
- double outputValue

  A vector of input connections.

6.4.1 Detailed Description

A class to handle the information contained in a general Neuron.

A general class for neurons. The MLPneuron and RBFneuron classes will specialize this general class

Definition at line 16 of file Neuron.h.

6.4.2 Constructor & Destructor Documentation

6.4.2.1 Neuron::Neuron ( )

Definition at line 12 of file Neuron.cpp.

```
{};
```

6.4.2.2 Neuron::Neuron (int *Id*)

        Id=id;
}
```

6.4.4 Member Data Documentation

6.4.4.1 int Neuron::Id [private]

An integer variable with the Neuron Id.

The Neuron Id provides a name to the neuron. This value is not expected to be used neither during simulation nor training but it provides an easy reference for human readers.

Definition at line 21 of file Neuron.h.

Referenced by getId(), and setId().

6.4.4.2 double Neuron::outputValue [private]

A vector of input connections.

Todo

restore VecCon<Con> listCon;

Definition at line 30 of file Neuron.h.

The documentation for this class was generated from the following files:

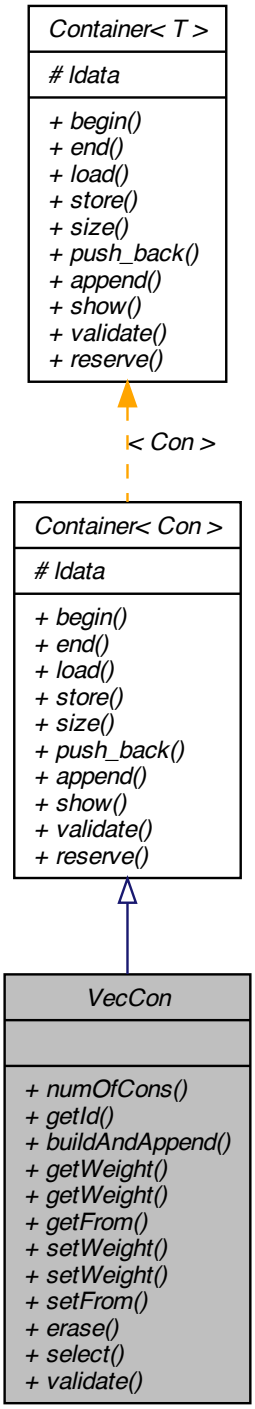
- pkg/AMORE/src/Neuron.h
- pkg/AMORE/src/Neuron.cpp

6.5 VecCon Class Reference

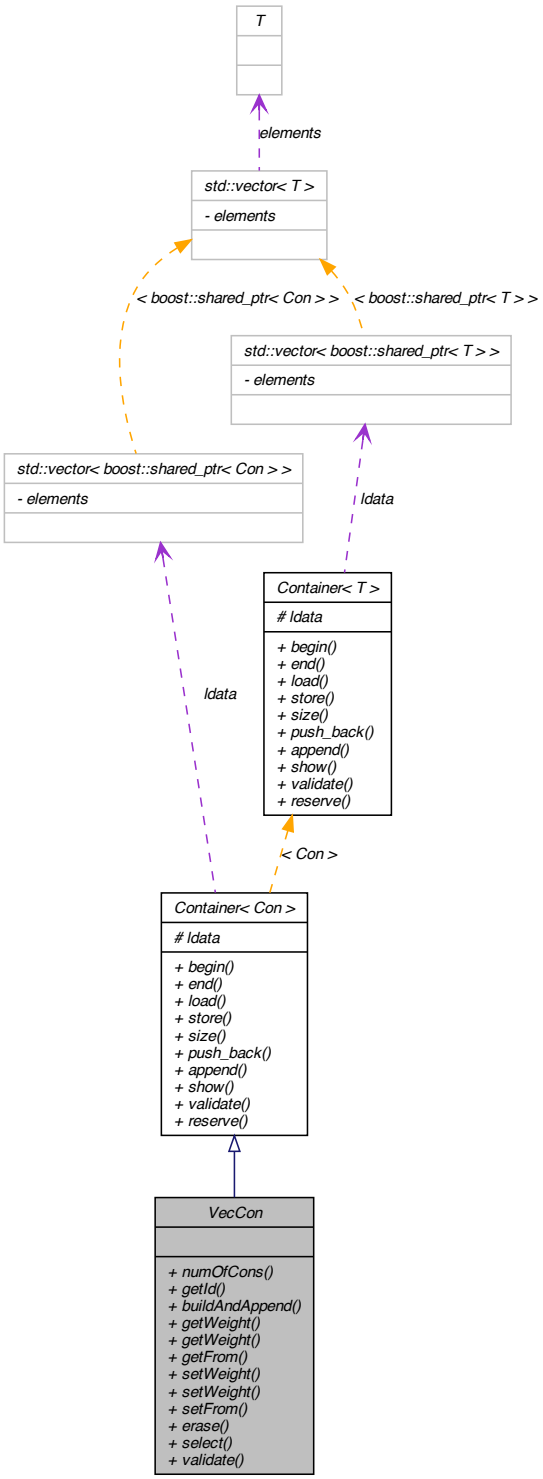
A vector of connections.

`#include <VecCon.h>`

Inheritance diagram for VecCon:



Collaboration diagram for VecCon:



Public Member Functions

- int numOfCons ()

  Size of the VecCon object.
- std::vector< int > getId ()

  Getter of the Id values of the vector of Cons.
- bool buildAndAppend (std::vector< NeuronPtr > vFrom, std::vector< double > vWeight)

  Builds Con objects and appends them to ldata.
- std::vector< double > getWeight ()

  Getter of the weight field of the Con objects related to VecCon.
- std::vector< double > getWeight (std::vector< int > vFrom)

  Getter of the weights of the specified elements from the vecCom object.
- std::vector< NeuronPtr > getFrom ()

  Getter of the from field of the Con objects related to VecCon.
- bool setWeight (std::vector< double > vWeight)

  Setter of the weight field of the Con objects related to VecCon.
- bool setWeight (std::vector< double > vWeight, std::vector< int > vFrom)

  Setter of the weights of the specified elements from the VecCon object.
- bool setFrom (std::vector< NeuronPtr > vFrom)

  Setter of the from fields of the Con objects related to VecCon.
- void erase (std::vector< int > vFrom)

  Erase the specified elements from the vecCom object.
- VecConPtr select (std::vector< int > vFrom)

  Selects the specified elements from the vecCom object.
- bool validate ()

  Object validator.

6.5.1 Detailed Description

A vector of connections.

The VecCon class provides a simple class for a vector of connections. It's named after the R equivalent Reference Class.

Definition at line 17 of file VecCon.h.

6.5.2 Member Function Documentation

6.5.2.1 bool VecCon::buildAndAppend (std::vector< NeuronPtr > *FROM*, std::vector< double > *WEIGHT*)

Builds Con objects and appends them to ldata.

This function provides a convenient way of populating a VecCon object by building and apending Con objects to ldata.

Parameters

FROM	A vector of smart pointers to the neurons to be used in the Con::from fields
WEIGHT	A vector of values to be set in the Con::weight fields

```
        //================
        //Usage example:
        //================
        // Data set up
                std::vector<int> result;
                VecCon MyVecCon;
                std::vector<NeuronPtr> vNeuron;
                std::vector<double> vWeight;

        // Test
                NeuronPtr ptNeuron( new Neuron(11) );
                vNeuron.push_back(ptNeuron);
                ptNeuron.reset( new Neuron(22) );
                vNeuron.push_back(ptNeuron);
                ptNeuron.reset( new Neuron(33) );
                vNeuron.push_back(ptNeuron);

                vWeight.push_back(12.3);
                vWeight.push_back(1.2);
                vWeight.push_back(2.1);

                MyVecCon.buildAndAppend(vNeuron, vWeight);

                result=MyVecCon.getId();

        // Now result is a vector that contains the values 11, 22 and 32.
```

See also

append and the unit test files, e.g. runit.Cpp.VecCon.R, for further examples.

Definition at line 132 of file VecCon.cpp.

References Container< Con >::ldata.

```
           {
        BEGIN_RCPP
        if (FROM.empty()) { throw std::range_error("[VecCon::append]: Error, FROM
       is empty"); }
        if (FROM.size() != WEIGHT.size() ) { throw std::range_error("[VecCon::bui
      ldAndAppend]: Error, FROM.size() != WEIGHT.size()"); }
        ldata.reserve(ldata.size() + FROM.size());
        ConPtr ptCon;
        std::vector<double>::iterator itrWeight = WEIGHT.begin();

        foreach (NeuronPtr itrFrom, FROM){
                ptCon.reset(  new Con( itrFrom, *itrWeight) );
                ldata.push_back(ptCon);
                itrWeight++;
        }
        return true;
        END_RCPP
}
```

6.5.2.2 void VecCon::erase (std::vector< int > *vFrom*)

Erase the specified elements from the vecCom object.

Provides a convenient way of removing some Con objects from the ldata field of the VecCon object.

Parameters

vFrom	An std::vector<int> with the Ids of the connections to remove.

```
//================
//Usage example:
//================

// Data set up
                std::vector<int> result;
                std::vector<NeuronPtr> vNeuron;
                VecConPtr       ptShvCon( new VecCon() );
                VecConPtr vErased;
                ConPtr  ptC;
                NeuronPtr ptN;
                int ids[]= {11, 10, 9, 3, 4, 5, 6, 7, 8, 2, 1};
                std::vector<double> vWeight;
                vWeight.push_back(11.32);
                vWeight.push_back(1.26);
                vWeight.push_back(2.14);
                vWeight.push_back(3.16);
                vWeight.push_back(4.14);
                vWeight.push_back(5.19);
                vWeight.push_back(6.18);
                vWeight.push_back(7.16);
                vWeight.push_back(8.14);
                vWeight.push_back(9.12);
                vWeight.push_back(10.31);

                for (int i=0; i<vWeight.size() ; i++) {                         /
/ Let's create a vector with three neurons
                        ptN.reset( new Neuron( ids[i] ) );
                        vNeuron.push_back(ptN);
                }
                ptShvCon->buildAndAppend(vNeuron, vWeight);

                // Test

                std::vector<int> toRemove;
                toRemove.push_back(1);
                toRemove.push_back(3);
                toRemove.push_back(5);
                toRemove.push_back(7);

                ptShvCon->erase(toRemove);
                ptShvCon->show();
                result=ptShvCon->getId();

          // The output at the R terminal would display :
          //
          // From:         2       Weight=         9.120000
          // From:         4       Weight=         4.140000
          // From:         6       Weight=         6.180000
          // From:         8       Weight=         8.140000
```

```
// From:         9       Weight=         2.140000
// From:         10  Weight=     1.260000
// From:         11  Weight=     11.320000
```

        ldata.resize(itr-ldata.begin());
}
```

6.5.2.3 std::vector< NeuronPtr > VecCon::getFrom ( )

Getter of the from field of the Con objects related to VecCon.

This function provides a convenient way of getting the values of the weight field of those Con object pointed to by the smart pointer stored in the VecCon object.

Returns

An std::vector<NeuronPtr> with the pointer to the incoming neurons.

```
//================
//Usage example:
//================
// Data set up
        std::vector<double> result;
        int ids[]= {1, 2, 3};
        double weights[] = {12.3, 1.2, 2.1 };
        VecCon MyVecCon;
        std::vector<NeuronPtr> vNeuron;
        std::vector<double> vWeight;
        NeuronPtr ptNeuron;

                for (int i=0; i<=2; i++) {
                        ptNeuron.reset( new Neuron(ids[i]) );
                        vNeuron.push_back(ptNeuron);
                        vWeight.push_back(weights[i]);
                }
                MyVecCon.buildAndAppend(vNeuron, vWeight);
        // Test
                vNeuron=MyVecCon.getFrom();
                for (int i=0; i<=2; i++) {
                        result.push_back(vNeuron.at(i)->getId());
                }

// Now result is a vector that contains the values 1, 2 and 3 .
```

```
                                                {
        std::vector<NeuronPtr> result;
        result.reserve(numOfCons());
        foreach(ConPtr itr, ldata){
                result.push_back( itr->getFrom() );
        }
        return result;
}
```

Here is the call graph for this function:

6.5.2.4 std::vector< int > VecCon::getId ( )

Getter of the Id values of the vector of Cons.

This function returns the Id's of the neurons referred to by the vector of Cons.

Returns

An std::vector<int> that contains the Ids

```
//================
//Usage example:
//================
      // Data set up
                        Neuron N1, N2, N3;
                        VecCon MyVecCon;
                        std::vector<int> result;

                        N1.setId(10);
                        N2.setId(20);
                        N3.setId(30);

                        ConPtr ptCon( new Con(&N1, 1.13) );     // Create new Con
     and initialize ptCon
                        MyVecCon.push_back(ptCon);                              /
```

```
/ push_back
                    ptCon.reset(  new Con(&N2, 2.22) );             // create
 new Con and assign to ptCon
                    MyVecCon.push_back(ptCon);                              /
/ push_back
                    ptCon.reset(  new Con(&N3, 3.33) );             // create
 new Con and assign to ptCon
                    MyVecCon.push_back(ptCon);                              /
/ push_back

  // Test
                    MyVecCon.show() ;
                    MyVecCon.validate();
                    result=MyVecCon.getId();

  // Now result is a vector that contains the values 10, 20 and 30.
```

Here is the caller graph for this function:

6.5.2.5 std::vector< double > VecCon::getWeight ( )

Getter of the weight field of the Con objects related to VecCon.

This function provides a convenient way of getting the values of the weight field of those Con object pointed to by the smart pointer stored in the VecCon object.

Returns

A numeric (double) vector with the weights

```
//================
//Usage example:
//================
// Data set up
        std::vector<double> result;
        VecCon MyVecCon;
        std::vector<NeuronPtr> vNeuron;
        std::vector<double> vWeight;

// Test
        NeuronPtr ptNeuron( new Neuron(11) );
        vNeuron.push_back(ptNeuron);
        ptNeuron.reset( new Neuron(22) );
        vNeuron.push_back(ptNeuron);
        ptNeuron.reset( new Neuron(33) );
        vNeuron.push_back(ptNeuron);

        vWeight.push_back(12.3);
        vWeight.push_back(1.2);
        vWeight.push_back(2.1);

        MyVecCon.buildAndAppend(vNeuron, vWeight);

        result=MyVecCon.getWeight();

// Now result is a vector that contains the values 12.3, 1.2 and 2.1 .
```

        }

        return result;
}
```

Here is the call graph for this function:

6.5.2.6 std::vector< double > VecCon::getWeight (std::vector< int > *vFrom*)

Getter of the weights of the specified elements from the vecCom object.

Provides a convenient way of getting the weights of some Con objects from the ldata field of the VecCon object.

Parameters

vFrom	An std::vector<int> with the Ids of the connections to select

Returns

An std::vector<double> with the weights of the selected connections

```
        //================
        //Usage example:
        //================

        // Data set up

                std::vector<double> result;
                std::vector<NeuronPtr> vNeuron;
                VecConPtr       ptShvCon( new VecCon() );
                ConPtr  ptC;
                NeuronPtr ptN;
                int ids[]= {11, 10, 9, 3, 4, 5, 6, 7, 8, 2, 1};
```

```
          double weights[]={11.32, 1.26, 2.14, 3.16, 4.14, 5.19, 6.18, 7.16
, 8.14, 9.12, 10.31};
          std::vector<double> vWeight;
          for (int i=0; i<11; i++) {
                  vWeight.push_back(weights[i]);
          }
          for (int i=0; i<vWeight.size() ; i++) {                         /
/ Let's create a vector with three neurons
                  ptN.reset( new Neuron( ids[i] ) );
                  vNeuron.push_back(ptN);
          }
          ptShvCon->buildAndAppend(vNeuron, vWeight);

  // Test
          std::vector<int> toSelect;
          toSelect.push_back(1);
          toSelect.push_back(3);
          toSelect.push_back(5);
          toSelect.push_back(7);

          result=ptShvCon->getWeight(toSelect);

  // Now, result is a numeric vector with the values  10.31, 3.16,  5.19 an
d 7.16.
```

}
```

6.5.2.10 bool VecCon::setWeight (std::vector< double > *vWeight*, std::vector< int > *vFrom*)

Setter of the weights of the specified elements from the VecCon object.

Provides a convenient way of setting the weights of some Con objects from the Idata field of the VecCon object.

Parameters

vWeight	A numeric (double) vector with the weights to be set in the Con objects contained in the VecCon object.
vFrom	An std::vector<int> with the Ids of the connections to select

Returns

true in case no exception is thrown

```
  //=================
  //Usage example:
  //=================

  // Data set up
          std::vector<double> result;
                  std::vector<NeuronPtr> vNeuron;

References Container< Con >::ldata.

```
                                                {
      BEGIN_RCPP
      if (vWeight.empty()) { throw std::range_error("[ C++ VecCon::setWeight]:
    Error, vWeight is empty"); }
      if (vWeight.size() != ldata.size() ) { throw std::range_error("[C++ VecCo
    n::setWeight]: Error, vWeight.size() != ldata.size()"); }
      std::vector<double>::iterator itrWeight = vWeight.begin();
      foreach (ConPtr itr, ldata){
              itr->setWeight( *itrWeight );
              itrWeight++;
      }
      return true;
      END_RCPP
}
```

6.5.2.12 bool VecCon::validate ( )

Object validator.

This method checks the object for internal coherence. A try / catch mechanism exits its normal execution and returns control to the R terminal in case the contents of the VecCon object are identified as corrupted.

Returns

true in case the checks are Ok.

Exceptions

An	std::range error if weight or from are not finite.
